

How to dynamically add data to an executable file (part 5 of 5)

Demo code and feedback

Demo code

You can download some *demo code* that includes source for two Delphi applications and a unit that implements the *TPayload* class. One application knows how to read and display payload data while the other can attach user defined data to the reader application.

The demo is provided as a zip file. Once downloaded the file should be unzipped to a new folder. Details of the files included in the zip file and instructions on how to compile and use the demo projects are provided in the *ReadMe* file that is included in the download.

TPayloadStream

The demo does not currently contain the source code for, or an example of using, *TPayloadStream*.

Download the demo code

Feedback

I hope you enjoyed this article and found it useful. If you have any observations, comments or have found any errors please *contact me*.
